## Model completeness of finitely ramified henselian valued field with various value groups

#### Anna De Mase

Università degli Studi della Campania "Luigi Vanvitelli"

7th December 2023

#### Transfer principles

- Model completeness for hens vf (0,p) valued in a Z-group
- Model completeness for hens vf (0,p) valued in an oag with finite spines
- Model completeness for hens vf (0,p) valued in an oag with spine of order type ω\* and no colors

## Valued fields

Let K be a field and G a totally ordered abelian group. A *valuation* over K is a surjective map

 $v: K \longrightarrow G \cup \{\infty\}$ 

satisfying the following conditions:

• 
$$v(a) = \infty \iff a = 0;$$

• 
$$v(ab) = v(a) + v(b);$$

• 
$$v(a+b) \ge min\{v(a), v(b)\}.$$

 $O = \{x \in K \mid v(x) \ge 0\}$  is the valuation ring. It is a local ring with unique maximal ideal  $M = \{x \in K \mid v(x) > 0\}$ . The quotient O/M = k is the *residue field* of the valuation v.

Cases:

• **2.** *char K* = 0, *char k* = *p*;

## Valued fields

Let K be a field and G a totally ordered abelian group. A *valuation* over K is a surjective map

$$v: K \longrightarrow G \cup \{\infty\}$$

satisfying the following conditions:

• 
$$v(a) = \infty \iff a = 0;$$

• 
$$v(ab) = v(a) + v(b);$$

• 
$$v(a+b) \ge min\{v(a), v(b)\}.$$

 $O = \{x \in K \mid v(x) \ge 0\}$  is the valuation ring. It is a local ring with unique maximal ideal  $M = \{x \in K \mid v(x) > 0\}$ . The quotient O/M = k is the *residue field* of the valuation v.

Cases:

• **2.** *char K* = 0, *char k* = *p*;

## Examples

1. Let *p* be a prime. The field of *p*-adic numbers

$$\mathbb{Q}_{p} = \left\{ \boldsymbol{a} = \sum_{i \geq k}^{\infty} a_{i} \boldsymbol{p}^{i} \mid \boldsymbol{k} \in \mathbb{Z}, a_{i} \in \{0, \dots, p-1\} \right\}$$

with the valuation  $v_p(a) = min\{i \mid a_i \neq 0\}$  (the *p*-adic valuation) with values in  $\mathbb{Z}$  and residue field  $\mathbb{F}_p$ .

**2.** Let *k* be a field and *G* an ordered abelian group. The valued field of *generalized power series* (or *Hahn field*)

$$k((G)) = \left\{ a = \sum_{g \in G} a_g t^g \mid a_g \in k, \text{ for all } g \in G \text{ and } supp(a) \text{ is well ordered} \right\}$$

with the valuation  $v_t(a) = min\{g \mid a_g \neq 0\}$  (the *t*-adic valuation) with values in *G* and residue field *k*.

## Examples

1. Let *p* be a prime. The field of *p*-adic numbers

$$\mathbb{Q}_{p} = \left\{ \boldsymbol{a} = \sum_{i \geq k}^{\infty} a_{i} \boldsymbol{p}^{i} \mid \boldsymbol{k} \in \mathbb{Z}, a_{i} \in \{0, \dots, p-1\} \right\}$$

with the valuation  $v_p(a) = min\{i \mid a_i \neq 0\}$  (the *p*-adic valuation) with values in  $\mathbb{Z}$  and residue field  $\mathbb{F}_p$ .

**2.** Let *k* be a field and *G* an ordered abelian group. The valued field of *generalized power series* (or *Hahn field*)

$$k((G)) = \left\{ a = \sum_{g \in G} a_g t^g \mid a_g \in k, \text{ for all } g \in G \text{ and } supp(a) \text{ is well ordered} 
ight\}$$

with the valuation  $v_t(a) = min\{g \mid a_g \neq 0\}$  (the *t*-adic valuation) with values in *G* and residue field *k*.

## Valued fields

#### Definition

A valued field is henselian if its valuation extends uniquely to every algebraic extension.

**Remark.**  $(\mathbb{Q}_{p}, v_{p})$  is henselian.

#### Theorem (Hensel's Lemma)

Suppose K is a pseudo-complete valued field, then it is henselian.

#### Definition

Let *K* be a valued field. We say that *K* is finitely ramified if char(k) = p and  $|\{v(x) : 0 < v(x) \le v(p)\}| = e < \infty$ . In particular, if e = 1 the field is unramified. The element with minimal positive valuation is called uniformizer.

Model completeness for hens vf (0,p) valued in a Z-group Model completeness for hens vf (0,p) valued in an oag with finite spines Model completeness for hens vf (0,p) valued in an oag with spine of order type a

## AKE - equicharacteristic zero

$$\begin{array}{l} \text{Consider } \mathfrak{L}_{\textit{rings}} = \{+, \cdot, 0, 1\}, \ \mathfrak{L}_{\textit{oags}} = \{+, 0, \leq\}, \text{ and} \\ \mathfrak{L}_{\textit{vf}} = (\mathfrak{L}_{\textit{Rings}}, \mathfrak{L}_{\textit{oags}}, \mathfrak{L}_{\textit{rings}}, \textit{v}, \textit{res}). \end{array}$$

#### Theorem (Ax-Kochen-Ershov principle)

Let  $(K_1, v_1)$ ,  $(K_2, v_2)$  be two henselian valued field whose residue fields  $k_1, k_2$  have characteristic 0 and let  $G_1, G_2$  be their value groups. Then

$$K_1 \equiv_{vf} K_2 \text{ iff } k_1 \equiv_{rings} k_2 \text{ and } G_1 \equiv_{oag} G_2$$

#### Theorem (Ax-Kochen-Ershov principle (<u>≺</u>-version))

Let  $(K_1, v_1), (K_2, v_2)$  be two henselian valued field whose residue fields  $k_1, k_2$  have characteristic 0 and let  $G_1, G_2$  be their value groups. Then

$$K_1 \preceq_{vf} K_2$$
 iff  $k_1 \preceq_{rings} k_2$  and  $G_1 \preceq_{oag} G_2$ 

Model completeness for hens vf (0,p) valued in a Z-group Model completeness for hens vf (0,p) valued in an oag with finite spines Model completeness for hens vf (0,p) valued in an oag with spine of order type  $\omega$ 

## AKE - mixed characteristic

#### Theorem (Bélair)

Let  $(K_1, v_1), (K_2, v_2)$  be two unramified henselian valued field with perfect residue fields  $k_1, k_2$  and let  $G_1, G_2$  be their value groups. Then

 $K_1 \preceq_{vf} K_2$  iff  $k_1 \preceq_{rings} k_2$  and  $G_1 \preceq_{oag} G_2$ 

#### Theorem (Anscombe-Jahnke)

Let  $(K_1, v_1), (K_2, v_2)$  be two unramified henselian valued field with arbitrary residue fields  $k_1, k_2$  and let  $G_1, G_2$  be their value groups. Then

$$K_1 \preceq_{vf} K_2$$
 iff  $k_1 \preceq_{rings} k_2$  and  $G_1 \preceq_{oag} G_2$ 

**Question**: Does the transfer hold for valued fields with (finite) ramification? **Answer**: In general, no.

Model completeness for hens vf (0,p) valued in a Z-group Model completeness for hens vf (0,p) valued in an oag with finite spines Model completeness for hens vf (0,p) valued in an oag with spine of order type  $\omega$

#### Definition

An ordered abelian group is called a  $\mathbb{Z}$ -group if it is elementarily equivalent to  $\mathbb{Z}$  as an ordered abelian group.

#### Proposition

The theory of  $\mathbb{Z}$  as an ordered abelian group has quantifier elimination in the Presburger language  $\mathfrak{L}_{pres} = \{+, 0, 1, \leq, \equiv_m\}_{m \in \mathbb{N}}$ , where 1 is a constant for the minimal positive element and  $a \equiv_m b$  iff  $a - b \in m\mathbb{Z}$ .

#### Theorem (Derakhshan-Macintyre)

Let K be a Henselian valued field of mixed characteristic (0, p) with finite ramification  $e \ge 1$ . Suppose the value group of K is a  $\mathbb{Z}$ -group. If the theory of the residue field k is model complete in the language of rings, then the theory of K is model complete in the language of rings.

## Some observations

## (i) let k be a field. If Th(k) is model complete in L<sub>rings</sub>, then k is perfect.

(ii) let *G* be a  $\mathbb{Z}$ -group, then  $G/\mathbb{Z}$  is a divisible ordered abelian group.

(iii) Let *K* be an henselian valued field of mixed characteristic (0, p) and ramification index *e*, and let n > e be an integer coprime with *p*. Then the valuation ring is existentially definable by the formula

$$\exists y(1 + px^n = y^n),$$

and the maximal ideal is existentially definable by the formula

$$\exists y(1+\frac{1}{p}x^n=y^n).$$

## Oags with finite spines

Let *G* be an OAG. For each positive integer *n* we recall the definition of the spine  $S_n$ :

#### Definition

For  $n \in \mathbb{N}$  and  $a \in G \setminus nG$ , let  $H_a$  be the largest convex subgroup of G such that  $a \notin H_a + nG$ ; set  $H_a = 0$  if  $a \in nG$ . Define  $S_n := G/\sim$ , with  $a \sim a'$  iff  $H_a = H_{a'}$ . and let  $s_n : G \longrightarrow S_n$  be the canonical projection. For  $\alpha = s_n(a) \in S_n$ , define  $\overline{H_\alpha} := H_a$ . Since the system of convex subgroups of an ordered abelian group are linearly ordered,  $S_n$  is an interpretable set linearly ordered by  $\alpha \leq \alpha'$  if  $\overline{H_\alpha} \subseteq \overline{H_{\alpha'}}$ . The structure  $(S_n, <)$  is called the n-spine of G.

## Oags with finite spines

#### Definition

If G is an OAG such that for each  $n \in \mathbb{N}$ ,  $|S_n|$  is finite, G is said to have finite spines.

Remark. All the  $\overline{H_{\alpha}}$  are definable in  $\mathfrak{L}_{oag}$  and, moreover, if *G* is a group with finite spines, then  $\{\overline{H}_{\alpha} | \alpha \in S_n, n \in \mathbb{N}\}$  are all the definable convex subgroups of *G*.

 $\implies$  *G* has only finitely or countably many definable convex subgroups that we denote with  $(H_i)_{i \in I}$ , where *I* is a finite or countable set of indexes.

< □ > < □ > < □ > < □ >

#### Proposition (Halevi-Hasson/Farré)

Let G be an ordered abelian group with finite spines and let  $\{H_i\}_{i \in I}$  be its definable convex subgroups for some I finite or countable. Then G has quantifier elimination in the the language:

 $\mathfrak{L} = \mathfrak{L}_{oag} \cup \{ (x =_{H_i} y + j_{G/H_i})_{i \in I, j \in \mathbb{N}}, (x \equiv_m^{H_i} y + j_{G/H_i})_{i \in I, j \in \mathbb{Z}, m \in \mathbb{N}} \}$ 

where  $j_{G/H_i}$  is j times the minimal positive element of the quotient  $G/H_i$ , if it exists, 0 otherwise.

Model completeness for hens vf (0,p) valued in a Z-group Model completeness for hens vf (0,p) valued in an oag with finite spines Model completeness for hens vf (0,p) valued in an oag with spine of order type a

## Model completeness

#### Proposition (D.M.)

Let G be an ordered abelian group with finite spines and let  $\{H_i\}_{i \in I}$  be its definable convex subgroups. Then G is model complete in the language:

$$\mathfrak{L} = \{0, +, -, \leq, (jc_i + H_i)_{j=0,1;i \in I}\},\$$

where  $c_i$  is a representative for the minimal element of the quotient  $G/H_i$  if it is discrete, 0 otherwise.

Model completeness for hens vf (0,p) valued in a Z-group Model completeness for hens vf (0,p) valued in an oag with finite spines Model completeness for hens vf (0,p) valued in an oag with spine of order type  $\omega$ 

< < >> < </p>

# Model completeness with value group with finite spines

#### Theorem (D.M.)

Let K be an Henselian valued field of mixed characteristic (0, p), finite ramification  $e \ge 1$ , and value group G with finite spines. If the theory of the residue field k is model complete in the language of rings, then the theory of K is model complete in the language  $\mathfrak{L} = \{0, +, \cdot, 1, A_{i,j}\}_{j=0,1;i \in I}$  where  $A_{i,j}$  is a predicate such that

$$A_{i,j}^{\mathcal{K}} = \{ a \in \mathcal{K} | v(a) = jc_i^G \mod H_i \},$$

where the  $(H_i)_{i \in I}$  are the definable convex subgroups of G and  $c_i$  is a representative for the minimal element of the quotient  $G/H_i$  if it is discrete, 0 otherwise.

## Proof

Assume  $K_1, K_2 \aleph_1$ -saturated. Note that:

- $G_1 \preceq G_2$  implies  $G_1 / \langle 1_{G_1} \rangle_{conv} \preceq G_2 / \langle 1_{G_2} \rangle_{conv}$ ;
- AKE in the equicharacteristic 0 case obtained by coarsening holds resplendently considering an expansion of the language of groups;
- the valuation is still  $\exists$  and  $\forall$ -definable by the same formula;
- if (*H<sub>i</sub>*)<sub>*i*∈*I*</sub> is an enumeration of the definable convex subgroups of *G*, it suffices to add predicates *A<sub>i,j</sub>* for *j* = 0, 1 to ℒ<sub>ring</sub> to have model completeness in a one sorted language.

## Example. Hahn series in one variable

Consider the field of Hahn series  $\mathbb{Q}_p((t^{\mathbb{Z}}))$  and the valuation

$$\mathsf{val}:\mathbb{Q}_{p}((t^{\mathbb{Z}}))\longrightarrow\mathbb{Z} imes\mathbb{Z}$$

such that

$$O_{val} = \{x | val(x) \ge 0\} = \{x | v_t(x) > 0 \text{ or } v_t(x) = 0 \land v_p(ac_t(x)) \ge 0\}.$$

By the Theorem,  $Th((\mathbb{Q}_p((t^{\mathbb{Z}})), val))$  is model complete in the language of rings together with two predicates  $A_0, A_1$  such that

$$\begin{array}{ll} \mathcal{A}_{0}^{\mathbb{Q}_{p}((t^{\mathbb{Z}})))} &= \{x \mid val(x) \in \{0\} + \mathbb{Z}\} \\ &= \left\{x \mid x = \sum_{i \geq 0} a_{i}t^{i}, a_{0} \neq 0\right\} = \mathbb{Q}_{p} + (t)^{>0}. \end{array}$$

$$\begin{array}{ll} \mathcal{A}_{1}^{\mathbb{Q}_{p}((t^{\mathbb{Z}}))} &= \{x \mid val(x) = (1,0) \mod (\{0\} + \mathbb{Z})\} \\ &= \left\{x \mid x = \sum_{i \geq 1} a_{i}t^{i}, a_{1} \neq 0\right\} = (t)^{>0}. \end{array}$$

Model completeness for hens vf (0,p) valued in a Z-group Model completeness for hens vf (0,p) valued in an oag with finite spines Model completeness for hens vf (0,p) valued in an oag with spine of order type  $\alpha$ 

## Example. Hahn series with many variables

We can consider the valuation

$$val_n: \mathbb{Q}_p((t_1^{\mathbb{Z}})) \dots ((t_n^{\mathbb{Z}})) \longrightarrow \bigoplus_{i=1}^{n+1} \mathbb{Z}^n$$

such that

$$O_{val_n} = \bigcup_{i=0}^n O^i,$$

where

$$\begin{array}{lll} O^n = & \{x \mid v_{t_n}(x) > 0\} \\ O^{n-1} = & \{x \mid v_{t_n}(x) = 0 \land v_{t_{n-1}}(ac_{t_n}(x)) > 0\} \\ & \vdots \\ O^0 = & \{x \mid v_{t_n}(x) = 0 \land v_{t_{n-1}}(ac_{t_n}(x)) = 0 \land \dots \\ & \land v_{t_1}(ac_{t_2}(\dots(ac_{t_n}(x)))) = 0 \land v_p(ac_{t_1}(\dots(ac_{t_n}(x))\dots)) > 0\} \end{array}$$

#### Example. Hahn series with many variables

By the Theorem, the theory of the valued field  $\mathcal{K} = (\mathbb{Q}_p((t_1^{\mathbb{Z}})) \dots ((t_n^{\mathbb{Z}})), val_n)$  is model complete in the language of rings together with predicates  $A_{i,j}$ ,  $i = 1, \dots, n, j = 0, 1$ , such that

$$\begin{array}{ll} {\cal A}_{i,0}^{{\cal K}} &= \{ x \in {\cal K} \mid val_n(x) \in {\cal H}_i \} \\ &= \{ x \in {\cal K} \mid x \in {\cal O}^i \wedge v_{t_i}(ac_{t_{i+1}}(\dots(ac_{t_n}(x))..)) = 0 \}. \end{array}$$

$$\begin{array}{ll} \mathcal{A}_{i,1}^{\mathcal{K}} &= \{ x \in \mathcal{K} \mid val_n(x) = \boldsymbol{c}_i^G \mod H_i \} \\ &= \{ x \in \mathcal{K} \mid x \in O^i \land v_{t_i}(\boldsymbol{ac}_{t_{i+1}}(\ldots(\boldsymbol{ac}_{t_n}(x))..)) = 1 \}. \end{array}$$

## The theory of the lexicographic sum of Z

**Example.** Assume that  $(G_{\gamma})_{\gamma \in \Gamma}$  is a family of non-trivial archimedean ordered abelian groups, where  $(\Gamma, <)$  is an ordered set. Consider the Hahn product

$$H = \{f \in \prod_{\gamma \in \Gamma} G_{\gamma} : f \text{ has well ordered support}\}.$$

Then the induced structure on the spine of *H* is  $(\Gamma, <, C_{\phi})_{\phi \in \mathfrak{L}_{oag}}$ , where  $C_{\phi}$  are unary predicates.

Let  $\mathfrak L$  be the language consisting of

- the main sort G with  $+, -, 0, <, \equiv_m (m \in \mathbb{N})$ ;
- an auxiliary sort  $\Gamma$  with  $<, 0, \infty, s : \Gamma \longrightarrow \Gamma$ ;

• 
$$val^n: G \longrightarrow \Gamma (n \in \mathbb{N}, n \neq 1),$$

- an unary predicate  $=^{\bullet} k_{\bullet}$  on *G* for each  $k \in \mathbb{Z} \setminus \{0\}$ ,
- an unary predicate  $\equiv_m^{\bullet} k_{\bullet}$  on *G* for each  $m \ge 2$  and  $k \in \{1, \dots, m-1\}$ .

< < >> < </p>

## QE

#### Fact

Let G be an oag with spine of order type  $\omega^*$  and no colors. Then the theory of G has quantifier elimination in  $\mathfrak{L}$ , where

- $\Gamma = \omega^* \cup \{\infty\}$ ,
- s(n) = n + 1,
- for every a ∈ G, val<sup>n</sup>(a) := minsupp(a mod nG) if a ∉ nG, val<sup>n</sup>(a) := ∞ otherwise (or equivalently val<sup>n</sup>(a) is the index i of the largest convex subgroup H<sub>i</sub> such that a ∉ H<sub>i</sub> + nG),
- for every a ∈ G, a =<sup>•</sup> k<sub>•</sub> if a + H<sub>i</sub> is k times the minimal element of G/H<sub>i</sub> for some i ∈ G,
- for every a ∈ G, a ≡<sup>•</sup><sub>m</sub> k<sub>•</sub> if a + H<sub>i</sub> is congruent modulo m to k times the minimal element of G/H<sub>i</sub> for some convex subgroup H<sub>i</sub>.

## Model completeness

#### Proposition (D.M.)

Let G be an oag with spine of order type  $\omega^*$  and no colors. Then the theory of G is model complete in the one sorted language  $\mathfrak{L}$  consisting of

+, −, 0, <,</li>

- for every  $n, m \in \mathbb{N}$  a relation symbol  $|^{n,m}$ ,
- for every  $n, m \in \mathbb{N}$  a binary predicate  $\overline{s}^{n,m}$ ,
- an unary predicate =• 1.

where

• 
$$x|^{n,m}y \iff val^n(x) \le val^m(y)$$
,

• 
$$\overline{s}^{n,m}(x,y) \iff val^m(y) = s(val^n(x),$$

 for every a ∈ G, a =• 1, if a + H<sub>i</sub> is the minimal element of G/H<sub>i</sub> for some convex subgroup H<sub>i</sub>.

Model completeness with value group an oag with spine of order type  $\omega^*$  and no colors

#### Theorem (D.M.)

Let *K* be an Henselian valued field with the same properties and value group an oag *G* with spine of order type  $\omega^*$  and no colors. If Th(k) is m.c. in  $\mathfrak{L}_{rings}$ , then Th(K) is m.c. in  $\mathfrak{L}_{rings}$  together with

- for every  $n, m \in \mathbb{N}$  a relation symbol  $||^{n,m}$ ,
- for every  $n, m \in \mathbb{N}$  a binary predicate  $\$^{n,m}$ ,
- an unary predicate A,

#### where

- for every  $x, y \in K$ ,  $x ||^{n,m} y \iff val^n(v(x)) \le val^m(v(y))$ ,
- for every  $x, y \in K$ ,  $(x, y) \iff val^m(v(y)) = s(val^n(v(x)))$ ,
- $A^{\kappa} = \{x \in K \mid v(x) = \mathbf{1}_{\bullet}\}.$

## Example infinite many variables

This language gives model completeness for the following valued field. Consider the field of Hahn series over  $\mathbb{Q}_p$  in infinitely many indeterminates

$$\mathcal{K} = \bigcup_{n \in \mathbb{N}} \mathbb{Q}_p((t_1^{\mathbb{Z}})) \dots ((t_n^{\mathbb{Z}})).$$

We can define, from the valuations  $val_n$  over  $\mathbb{Q}_p((t_1^{\mathbb{Z}})) \dots ((t_n^{\mathbb{Z}}))$ , a valuation  $val_{\infty}$  over  $\mathcal{K}$  with values in  $\bigoplus_{i < \omega^*} \mathbb{Z}$ , such that

$$O_{\mathit{val}_\infty} = igcup_{\mathit{n} \in \mathbb{N}} O_{\mathit{val}_n}.$$
